Yogitha Kovalan

Spotify Music Trends Analysis

Data Visualization Project | Tableau Public | March 2026

About This Project

I am Yogitha Kovalan and this is my first data visualization project. I used Tableau Public to analyse a real Spotify dataset with over 114,000 songs across 114 music genres. I built 5 charts from scratch and combined them into one interactive dashboard.

The whole project was done by me independently — from downloading the tools and data, to building each chart, fixing problems along the way, and finally publishing the finished dashboard.

The 5 Charts I Built

Chart 1: Top Genre

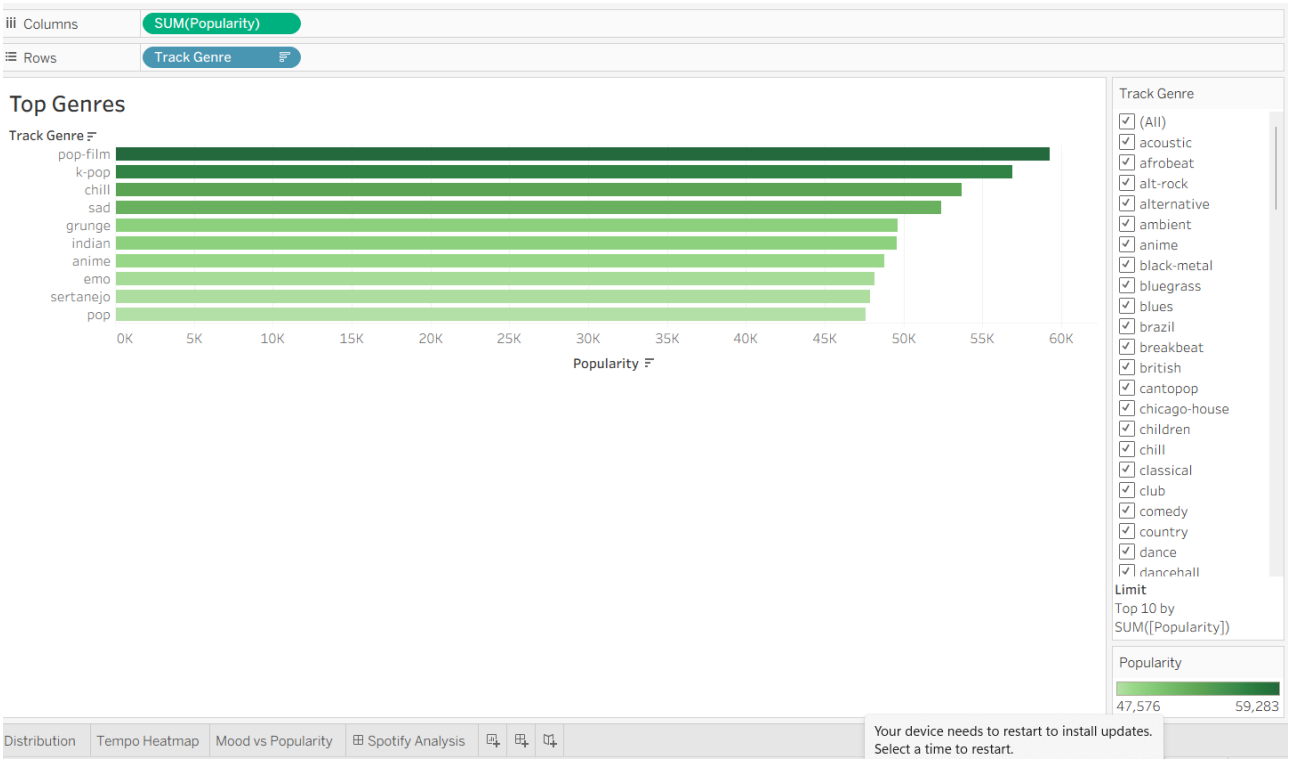

Chart 2 — Energy vs Danceability

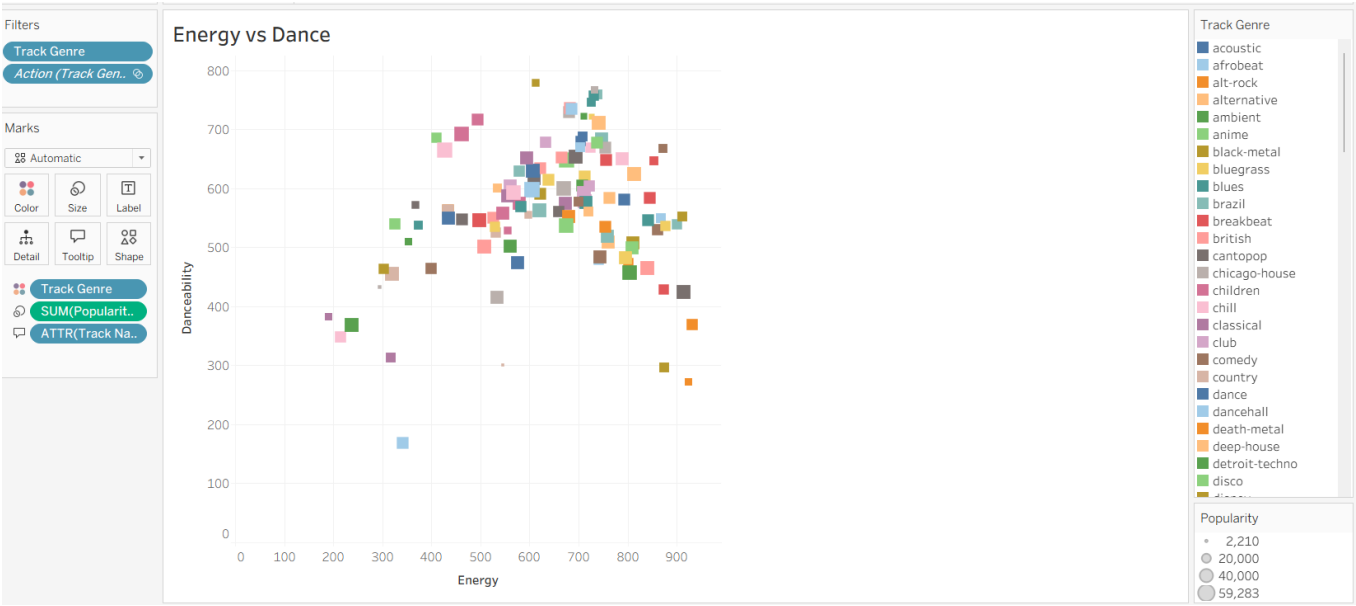

Chart 3 — Popularity Distribution

Chart 4 — Tempo Heatmap

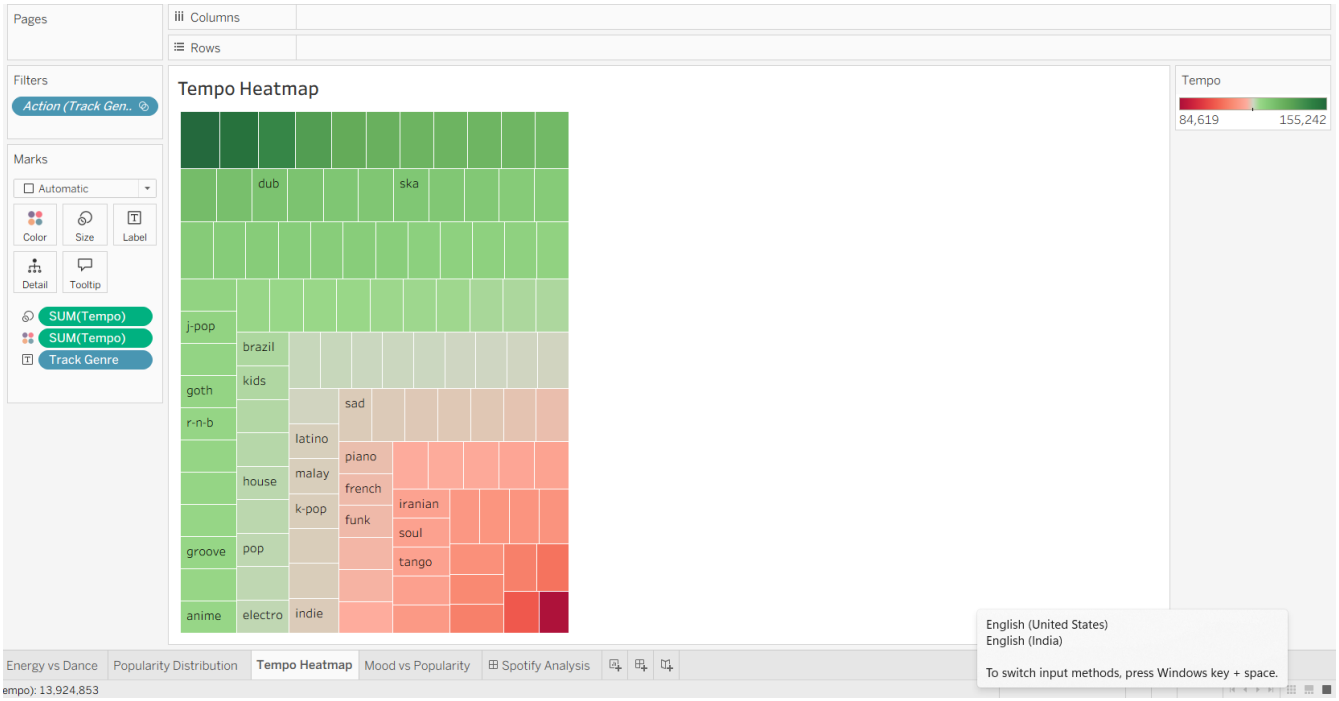

Chart 5 — Mood vs Popularity

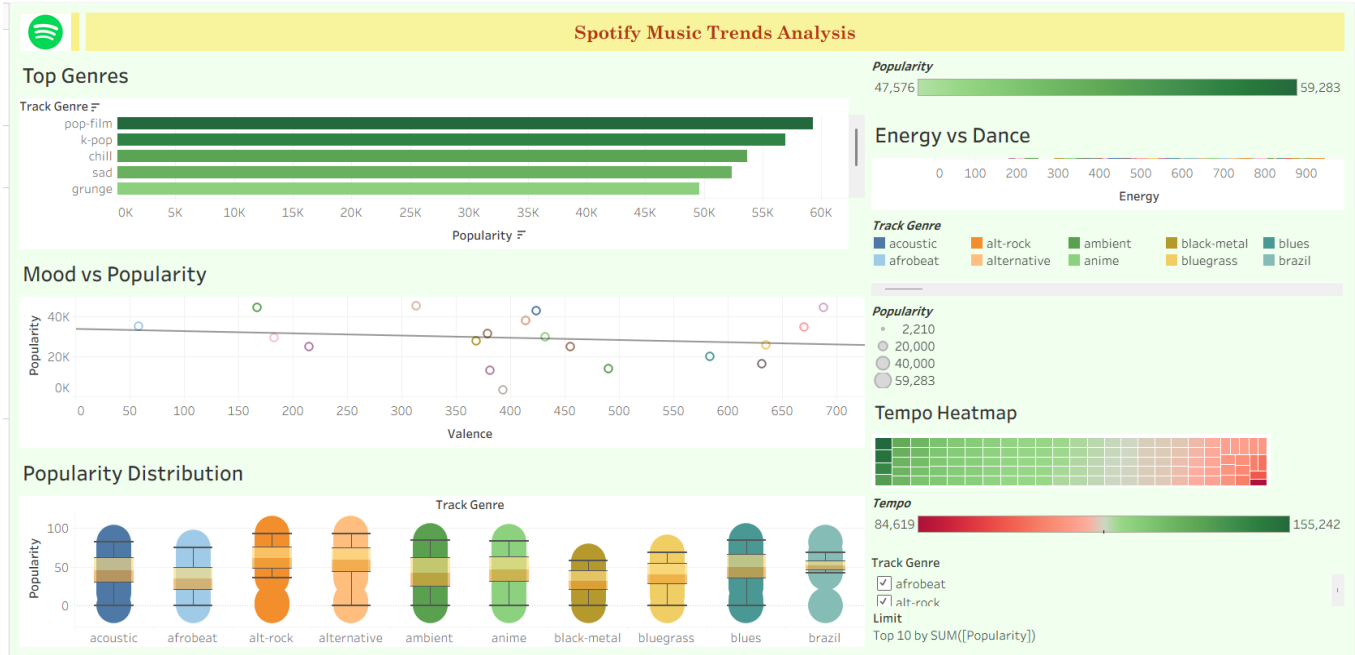
The Final Dashboard



After finishing all 5 charts I combined them into one dashboard called Spotify Analysis. Here is what it includes:

- All 5 charts arranged in a clean layout — Top Genres and Mood vs Popularity on the left, Energy vs Dance, Tempo Heatmap and Popularity Distribution on the right.
- The Spotify logo added to the top left corner.
- The title Spotify Music Trends Analysis in bold green text at the top.
- A light background with the charts organized so everything is visible at once.
- Interactive filter — clicking on any genre in the Top Genres chart automatically updates all the other charts to show only that genre.

What I Found From the Data

- Pop-film, K-pop and chill are the most popular genres by total popularity score.
- The most popular single song in the whole dataset is Unholy by Sam Smith and Kim Petras with a perfect score of 100.

- EDM has the highest combined energy and danceability — it is basically made for moving.R&B tracks have a very tight popularity range — they get steady attention but rarely go viral like pop songs do.
- There is no strong link between how happy a song sounds and how popular it is. Sad songs do just as well as happy ones.
- Classical and acoustic genres have the slowest tempo while electronic and dance genres are the fastest.
